Animations

Pragma currently only supports rendering image sequences, which means you still need a video editing program to merge the individual frames into a video.

To render an image sequence in Pragma, all you have to do is increase the `Number of frames` slider in the `Render` tab: 

If you want to render all of the frames of the current clip/session, you can just right-click on the slider and choose `To end of clip`/`To end of session`. If you now click on `Render Image(s)`, all of the frames will be rendered one after another. You can click `Open Output Folder` to open the image location in the explorer.

> The `Number of frames` session does *not* affect preview renders. The `Render Preview` button will always only render a single frame, and it will also not save the rendered image to the disk.

> Pragma does not check if you have enough disk space available for all of the images, so make sure there is enough space before to start the render.
